

Mustapha HAIN ENSAM-Casablanca Mustapha.hain@ensam-casa.ma

Une base de données (en anglais database), permet de stocker et de retrouver des données structurées.

une table est un ensemble de données organisées sous forme d'un tableau structuré en colonnes et des lignes

### EMPLOYEE

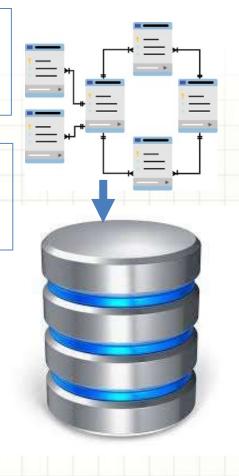

ID : NUMBER

F\_NAME : VARCHAR L\_NAME : VARCHAR

SALARY : NUMBER

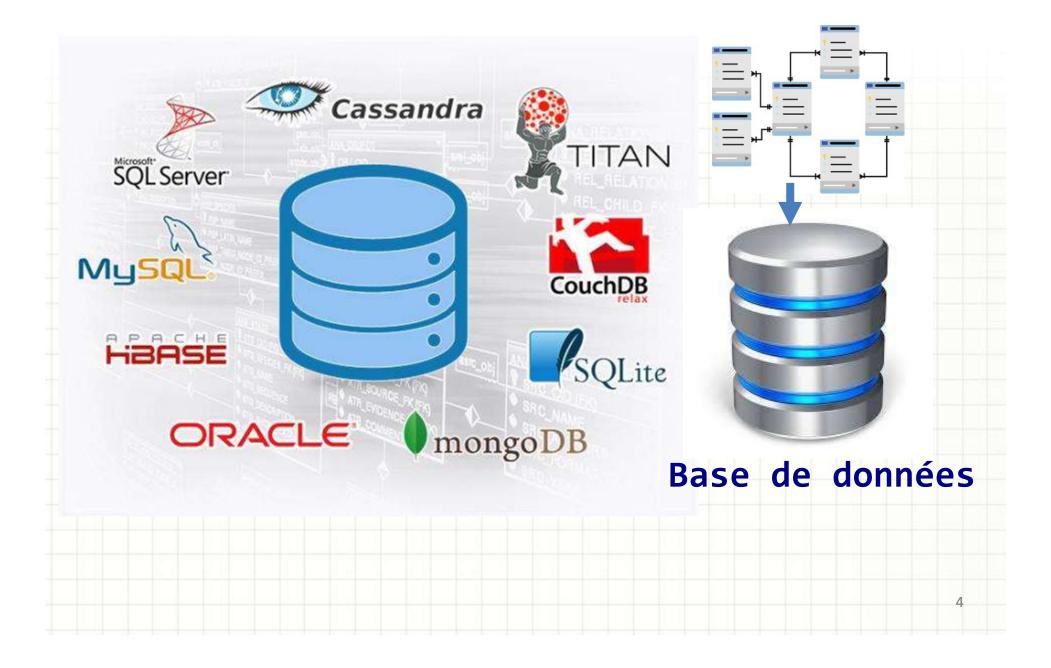

MANAGE\_ID : NUMBER

ADDRESS\_ID : NUMBER

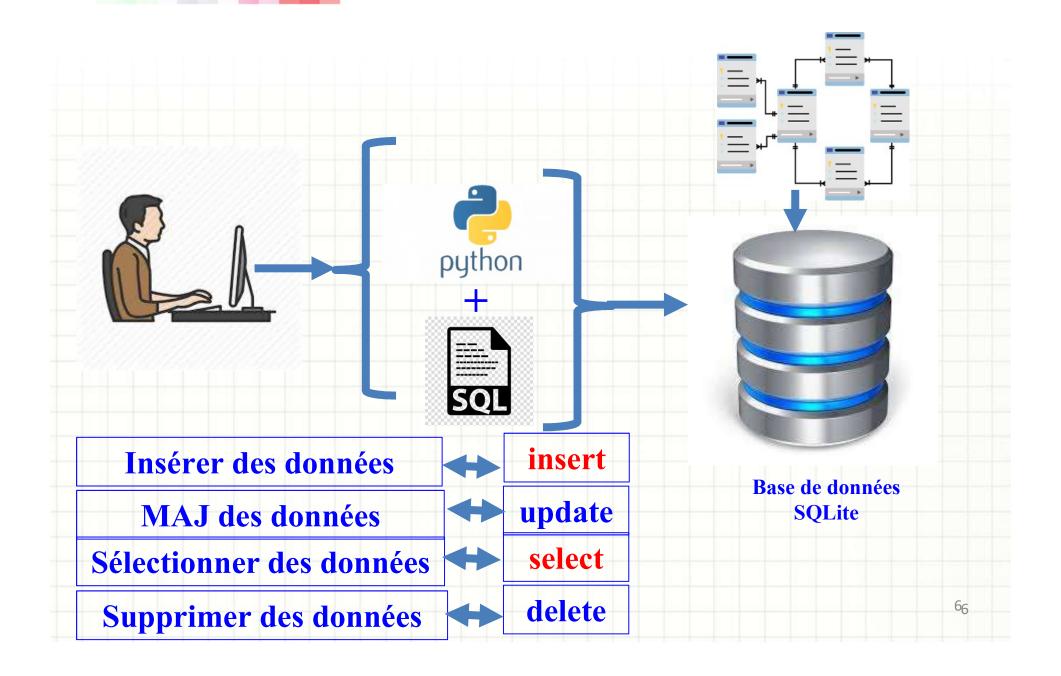

Base de données

SQL (Structured Query Language) est un langage permettant de communiquer avec une base de données.

```
import sqlite3
db=sqlite3.connect("gestion.db")
db.execute("create table if not exists person(id integer)")
db.execute("insert into person(id) values(?)",(10))
db.execute("insert into person(id) values(?)",(11))
db.commit()
db.row factory=sqlite3.Row
cursor=db.execute("select * from person")
for row in cursor:
   print(row["id"])
db.close()
```

```
db.execute("delete from person where id=10")
db.commit()
cursor=db.execute("select * from person")
for row in cursor:
print(row["id"])
db.close()
```

```
db.execute("update person set id=20 where id=10")
db.commit()
cursor=db.execute("select * from person")
for row in cursor:
print(row["id"])
db.close()
```

```
def affiche():
    cursor = db.execute("select * from person")
    for row in cursor:
        print(row["id"])
affiche()
affiche()
```
